

What is this class about?

EFB 390: Wildlife Ecology and Management

Dr. Elie Gurarie

August 28, 2023

1 / 23

This class is called

Wildlife Ecology and Management

which begs some questions ...

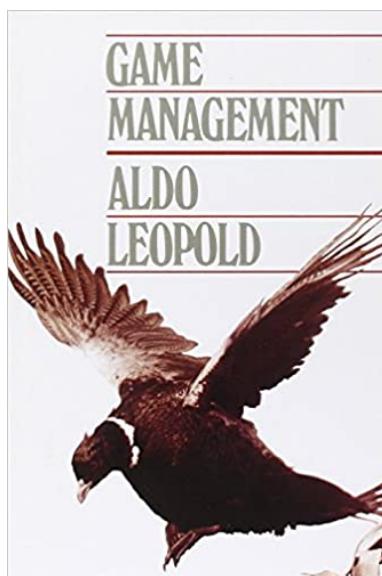

2 / 23

What is wildlife?

3 / 23

Is wildlife: Only game species...?

wild (adj.) from Proto-Germanic *wildia-* (source also of Old Saxon *wildi*, Old Norse *villr*, Old Frisian *wilde*, Dutch *wild*, Old High German *wildi*, German *wild*, Gothic *wilpeis* "wild," German Wild (n.) "game")

4 / 23

According to U.S. Federal Law

Fish and wildlife means any member of the animal kingdom, including without limitation any mammal, fish, bird (including any migratory, non-migratory, or endangered bird for which protection is also afforded by treaty or other international agreement), amphibian, reptile, mollusk, crustacean, arthropod, or other invertebrate, and includes any part, product, egg, or offspring thereof, or dead body or part thereof.

CFR: Title 50 - Wildlife and Fisheries § 36.2.

5 / 23

Words matter (legally)

The California ESA protects “*native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant.*” Notably, **no invertebrates**.

But in a lucky loophole for insects, the CESA defines a “**fish**” as “*a wild fish, mollusk, crustacean, invertebrate, amphibian, or part, spawn, or ovum of any of those animals.*”

California bees can legally be fish and have the same protections, a court has ruled

(click here for link)

Judge says: Although the term *fish* is colloquially and commonly understood to refer to *aquatic species*, the term of art employed by the Legislature in the definition of *fish* in section 45 is **not so limited**.

6 / 23

Wildlife: a working definition

All terrestrial and marine vertebrates but not domesticated animals. This includes game, non-game species, feral animals, invasive/exotic, and native species.

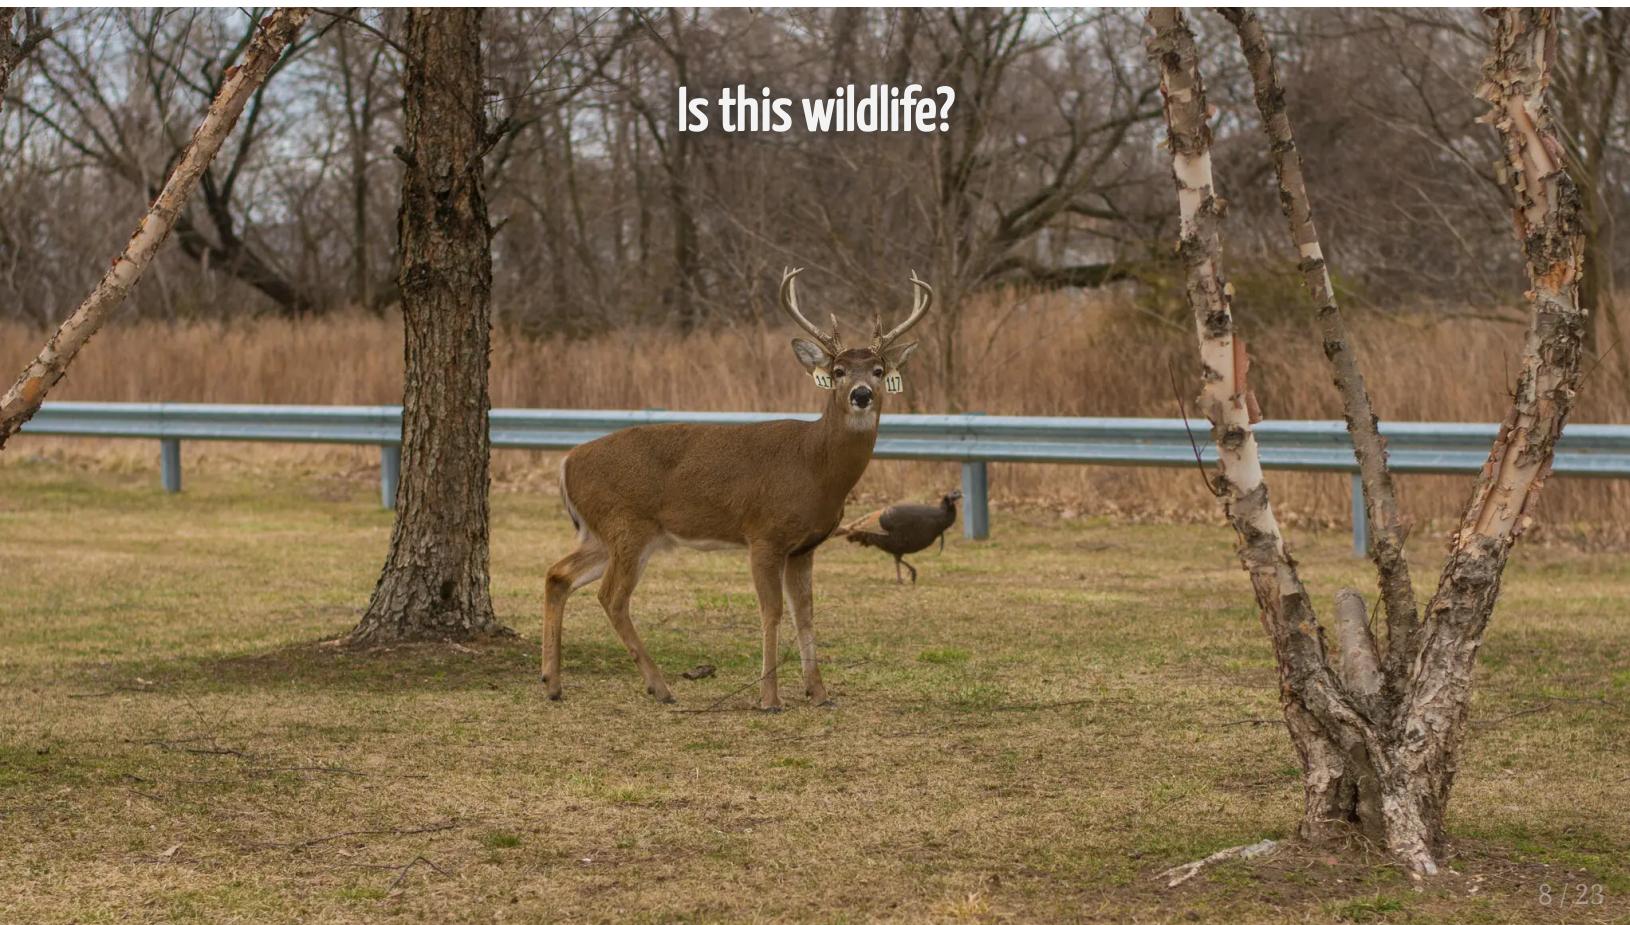

Are these all wildlife?

7 / 23

(noster. Dieter Braun)

Is this wildlife?

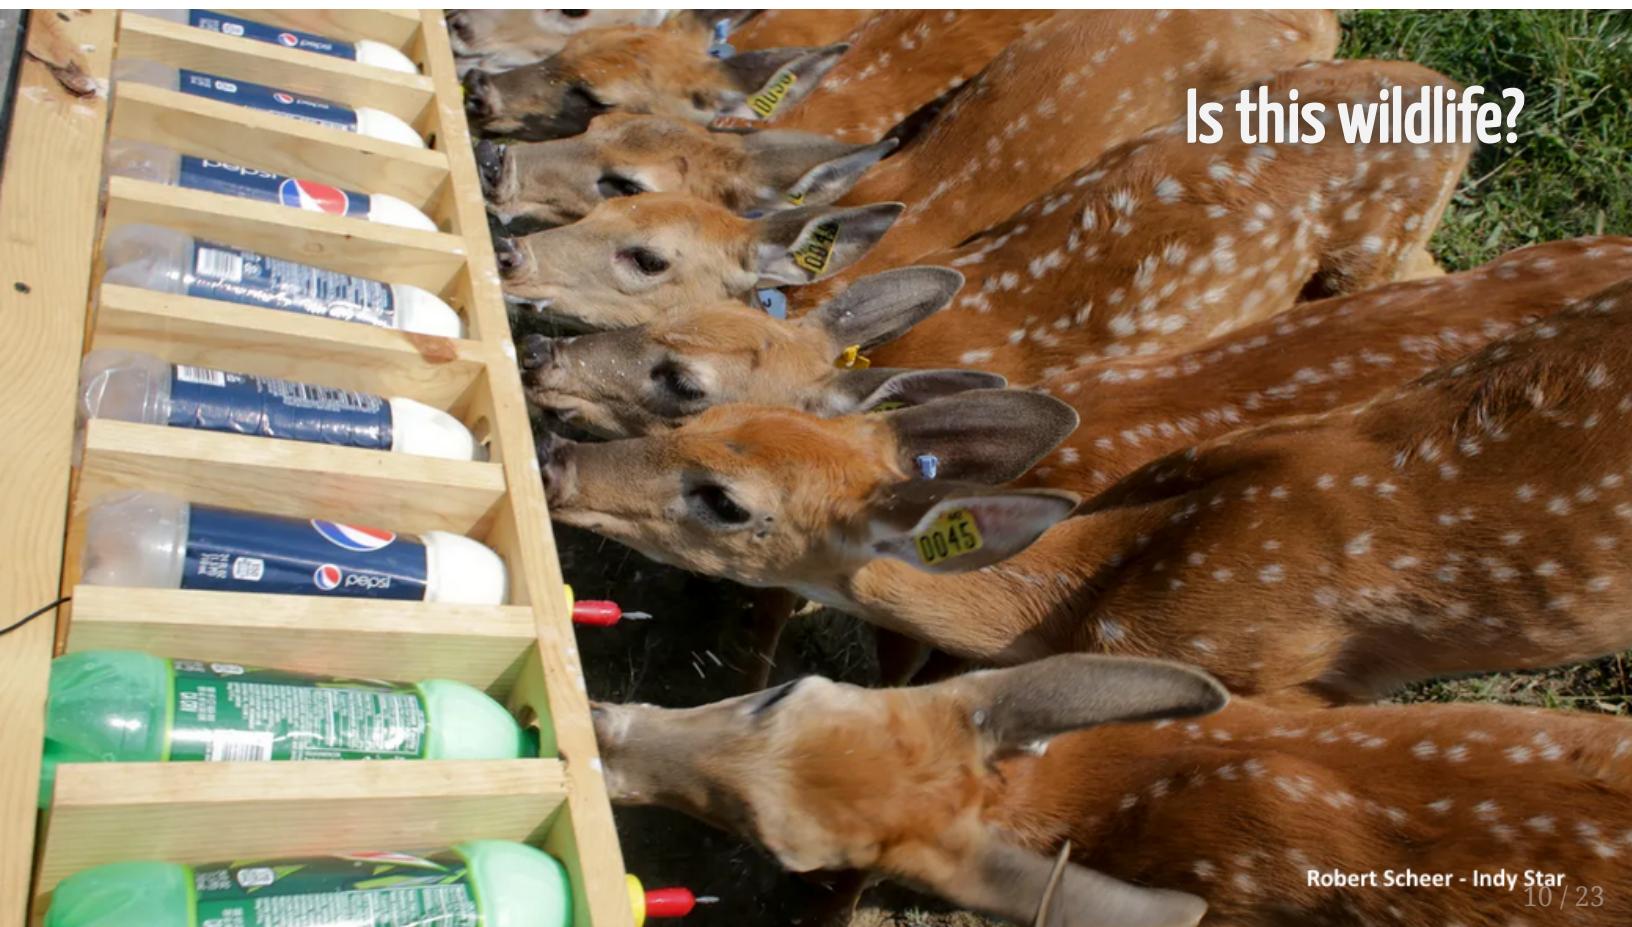

8 / 23

Is this wildlife?

Robert Scheer - Indianapolis Star
9 / 23

Is this wildlife?

Robert Scheer - Indy Star
10 / 23

Is this wildlife?

As a matter of science ...

These are all completely **semantic** debates. The general forces that govern the evolution, population, distribution, interactions of **ALL** living things are **fundamentally similar.**)

You learn the most by thinking about *processes* and "*model systems*", not worrying about whether lobster, fish, plankter, bison or whale.

... but as a matter of:

management | law | society | use

categories and definitions end up being extremely important!

What does a **wildlife Ecologist** study?

13 / 23

Wildlife ecology (in brief) ...

is the interaction among free-living wild animals and their environment.

- It is a branch of ecological *science*, i.e., a process of inquiry.
- There are questions, hypotheses, observations, a variety of tools to collect the information and to try to answer those questions.
- As a science, it is **incredibly complex**, riddled with uncertainty, imperfect observations, etc.

IMHO ...

It is the **most interesting** and **most fun** field to work in ever.

14 / 23

What are the goals of Wildlife Management?

15 / 23

Wildlife Management

Restrictive definition

Management of wildlife populations in the context of the ecosystem. (FSC book)

(i.e. implementation of actions that directly/indirectly impact the population).

Goals of wildlife management

1. Make it increase
2. Make it decrease
3. Harvest for a continuing yield
4. Leave it alone (but keep an eye on it)

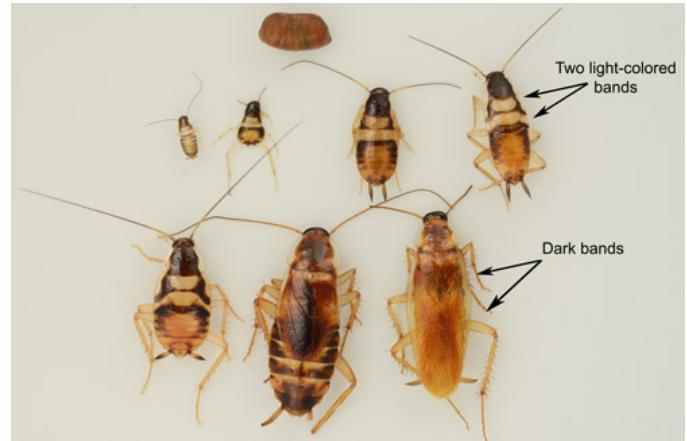

16 / 23

Broader definition of Wildlife Management ...

... a story (about a good friend, Dr. Furarie)

One day, Dr. F (*not an entomologist*) casually observed a fascinating bug in the kitchen, then went (with family) on a several week vacation. (thinking *huh! cute beetle!*)

Spoiler: It was not a beetle!

Returned some time later to see dozens scurrying under appliances in kitchen.

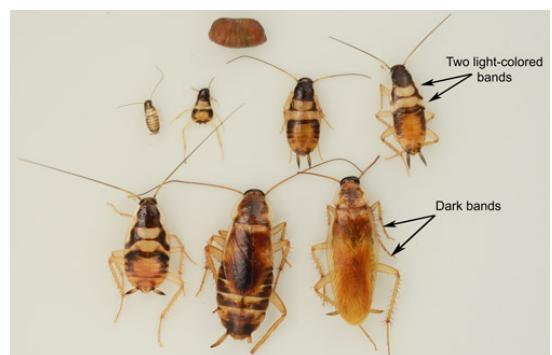

Brown-banded cockroach (*Supella longipalpa*)

not usually considered "wildlife" ... but - in California - can 17 / 23

Management objective...

articulated clearly and unambiguously (mainly by partner): **Eliminate ASAP!**

Step 1. Consulted with professional "managers" (aka *exterminators*) - who suggested emptying house for several weeks and fumigating fully, for THOUSANDS of dollars.

More nuanced objective:

Reduce numbers while balancing costs and feasibility!

Ecology of *Supella longipalpa*

- **Behavior:** Social, Nocturnal
- **Habitat:** Dark areas, under appliances / sink / crevasses. Need not be moist, Between 25 C and 33 C.
- **Diet:** anything
- **Population ecology:** Females leave oblong, ~5 mm egg case (*ootheca*) contain ~15 offspring. Glues the casing to cabinets or walls. One female lays ~15 casings in a lifetime. Females live between 13-45 weeks, each adult will produce from 90-276 roaches per year.
- **Natural predators:** Very few ... but, spiders!

Egg case (*ootheca*)

Predation!

Management plan:

Habitat

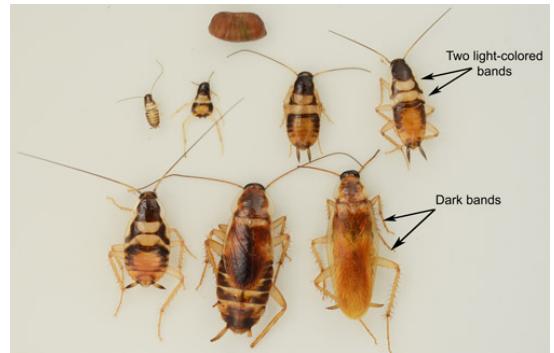

- Extreme cleanliness of kitchen (**diet**)
- Regular monitoring of usual **habitats**
- Freezing of potential habitats (toaster, microwave, easy in Wisconsin winter)

Population ecology

- Removal of adults (with **vacuum technology**)
- Discovery and destruction of ootheca

Inter-species interactions

- Very firm **spiders are our friends** policy.

Regular monitoring

- do rounds every night, until numbers decrease enough (then allowed to slack off).

Supella longipalpa are not "Wildlife" but ...

this story touches (on a small scale) on universal themes of wildlife management

- A **management goal**. This is *not* science. This is **social / cultural / political**.
- Basic knowledge of **biology** and **ecology**:
 - *diet, habitat, interactions, reproductive ecology*
- Using the knowledge to develop (and agree upon) a **management plan**.
- Tools and protocols for **monitoring**
- Tools and protocols for **implementing** the management goal.

21 / 23

Major takeaway:

Management is (almost) *never* a One-Time-Deal - it is an *adaptive and dynamic process*, an ongoing interaction, a dance of knowledge, monitoring, intervention, effort, communication and adaptation, that involves **economic, social, political, ethical** considerations.

22 / 23

Assignment (due next Tuesday, Sep. 5):

Find **three popular press articles** about the interaction of wildlife and humans from the past year, involving **different species and different geographical areas** (at least one outside the United States). These should be **news** (not editorial or opinion pieces).

Write a short summary, identifying:

- the species (one or more) involved,
- the location of the interaction,
- the nature of the interaction: (e.g. conflict, intervention, conservation, harvest, something else)
- whether there was a role played by wildlife ecologists, government agencies, non-government organization (NGO), the citizenry, random individuals.

Readings

Chapters 1 and 2 from Taber and Payne (uploaded on **BLACKBOARD**)
